

ABSTRACT

A vertical soap article display rack is attached to the front of grocery shelves. The display

includes one to six modules, where each module is constructed of a substantially open

frame such as wire. The module includes a bottom support with a front retaining lip; and

5 a circumferential frame, such as a stiff wire to contain a stack of soap articles, and a

removal slot between the frame and the bottom support. A soap article may be placed in

a stack within the frame and removed by a customer through the removal slot. A portion

of the front may be open.
